

One Coater Isn't Enough!

Today, once considered special printing enhancements like UV inks and gloss or other protective coatings have become commonplace. Maybe you don't have UV yet, but you probably already have a coater at the end of the press (if you don't – see **SLIC+** below). However, in order to remain profitable and keep a competitive edge, you need to differentiate your capabilities. After all, you can't "outprint" your competition. The way to profitability, is to convert more into each printed sheet. The best way to do that is with **SLIC** - *the moveable coating device that can be added to any offset printing unit.*

Chambered Anilox System

SLIC allows you to switch between printing offset inks and specialty coatings in about 10 minutes [anywhere in your press.](#)

With **SLIC** you can print:

- Pearls
- Glitter
- Soft Touch
- Fluorescents
- Textured effects
- Foiling metallic effects
- Gloss and matte coatings
- Opaque colors (equal to 4 offset inks)

Compact and retractable

Special materials all inline, over or under your offset inks, in ONE PASS!

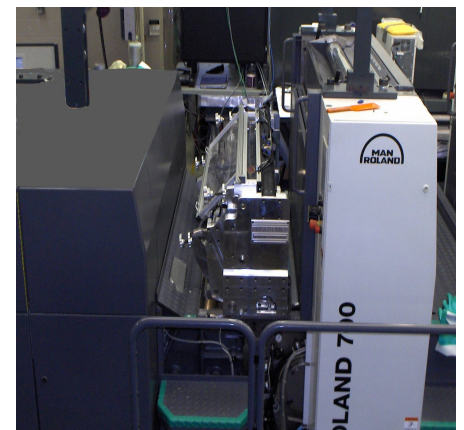

If you don't have a coater at the end of your press.....
get **SLIC+**

Turn your 4 color press into a 4 color + coating press.

SLIC+ is a **SLIC** coater with it's own blanket cylinder. The machine automatically registers with your print units. UV or aqueous coat your sheets inline. The unit can be quickly moved and stored over the delivery.

With hundreds of machines running in over 40 countries, from sheetfed and web offset, to flexo, and screen printing, we have the experience and expertise to expand your company's capabilities and profits. Contact us to explore the possibilities of our coating and drying equipment.

ARADIANT®

SLIC+: Adds a coating unit without using a printing unit

What about UV?
