

UV or not UV?

It's no longer a question of whether you do it – but *how* you do it.

Regardless, we can help! If you're not printing UV yet we can help you understand the benefits and build a system for you. If you are, do you know the differences between classic UV, LED UV, "H" UV, and LE UV as you look to expand your UV capabilities? Either way, we can supply you the insight and equipment.

MULTIMODE UV:
cures any UV ink or coating.

ARADIANT has been in UV for 30 years; manufacturing equipment and teaching operators how to print UV. In fact, we've been in the UV business longer than any of the competition. This experience gives us the edge in working with you – THE END USER to learn and take advantage of the equipment and know-how that we have. Since we deal directly with YOU, you **get the best equipment for less investment.** From initial meeting, to printed results: we build it, install it, train you on it, and service it. Parts and supplies are in stock and fairly priced. Others tell you that they will supply and service the equipment – but where does it come from, who's selling it, and who comes when you need help?

With Aradiant's new **MULTIMODE UV**, you can cure any type of UV ink or coating, including classic, LED, "H", and LE. You're no longer boxed into one type of ink or coating formulation. In addition, you can have end-of-press, and/or interdeck lamps tailored for what you want to produce; and with Aradiant's modular construction, you can add more units later.

Refrigerated water-cooled
No Ozone No Exhaust needed
Better for the environment!

Why UV is better:

- Dries immediately
- No Spray Powder
- Higher Gloss & Protection
- Fewer Wash-ups
- Better rub resistance
- Dry trap inks
- Gloss/Matte in one pass
- Spot effects in perfect register

Don't forget the coating!
